Scientific applications need to make use of a number of heterogeneous and often distributed resources that include both data and computations. My research focuses on developing tools and techniques that enable easy, efficient, and reliable execution of complex applications in distributed environments. Particular emphasis is given to managing applications specified as computational workflows. My research encompasses a number of areas including task scheduling, performance optimization, reliability techniques, resource provisioning, and workflow monitoring and troubleshooting. One of the tools developed in my group is the Pegasus Workflow Management System that is being used day-to-day in a number of scientific applications including astronomy, biology, earthquake science, gravitational-wave physics and others. The applications make use of their own computing clusters, national cyberinfrastructure, and Cloud computing resources. My research interests also include data and metadata management in scientific applications.

1997-2000

Senior Software Developer, University of California

Los Angeles, CA

Conducted research in parallel simulation of message-passing programs and performance modeling.

Participated in the POEMS project, which aims to design a system for Performance Oriented End-to-End Modeling of Large Heterogeneous Adaptive Parallel/Distributed Computer/Communication Systems. Major development was geared towards efficient and accurate simulation of message-passing programs (such as those using MPI) on high performance systems (such as the IBM SP). New SMP-cluster architectures were

modeled. Compiler optimizations which improved the efficiency and scalability of the simulator were investigated. The POEMS project involves a collaboration between several universities: Purdue, Rice, UCLA, U.T. Austin, U.T. El Paso, U. of Wisconsin and LANL.

Guest lectured in parallel computation courses.

Guided the research of graduate students.

EDUCATION

1997

Doctor of Philosophy in Computer Science

Rensselaer Polytechnic Institute

Troy, NY

"Performance Optimization of Parallel Discrete Event Simulation of Spatially Explicit Problems"

Developed an object oriented Parallel Discrete Event Simulation System that uses the optimistic approach to event processing. The system was designed to run on an MIMD machine and tested on an IBM SP. In order to achieve good performance, new synchronization techniques were formulated. Developed a new algorithm to continuously monitor the progress of all simulation processes. Designed a new approach for rolling back computation in spatially explicit problems. This approach resulted in a speedup close to linear over a single processor run. Load balancing techniques were also investigated.
